

Detent Clevis Pins

Ball detent depresses and springs up to hold clevis pin in place. Used for assembly speed or hard-to-cotter applications. This fastener lowers labor costs, and offers quick release features for flush-mount applications.

Made to order, detent clevis pins are based on standard clevis pin head and shank dimensions. Ends are pointed for easy insertion. Pins are typically zinc plated carbon steel and the ball detent is stainless type 302.

Ball tension can be adjusted to meet force required to insert and remove. All parts are subject to rigid quality control procedures for long life service.
